What are the Services?

The experienced professionals in our computer forensics and e-discovery practice assist firms facing significant litigation, allegations of fraud or irregular business activities, and investigations of potential employee misconduct. Our professionals secure and collect electronically stored information, prepare this information for review, and analyze data and metadata. We present our clients with a comprehensive understanding of relevant transactions, user activity and communications, enabling them to respond in conducting investigations and addressing litigation.

E-Discovery Services

Our professionals utilize advanced e-discovery technology to assist clients in efficiently identifying potentially responsive documents to an investigation or litigation, utilizing solutions that remove non-relevant data through data filtering, deduplication, keyword searching, and metadata analysis.

Computer Forensic Services

Our services include the collection and preservation of electronically stored information, following the U.S. Department of Justice's Search and Seizure guidelines, and the International Association of Computer Investigative Specialists (IACIS) guidelines for Forensic Examination of Computers and Digital and Electronic Media.

Our professionals can also analyze individual conduct, such as deletion activity, file copying, web browsing, and wiping & secure deletion activity. We can also search live and deleted files, unallocated space and slack space based on keywords or concepts. Furthermore, our team can identify known system and user files, as well as duplicate files, to limit and expedite the review of documents.

Computer Forensics Lab

Our professionals utilize the dedicated state-of-the-art computer forensics lab of the BDO Alliance organization for the secure storage and analysis of electronically stored information. This lab is outfitted with industry standard computer forensics and e-discovery software, and is complemented by powerful workstations to address the typical and atypical needs of our clients as rapidly as possible. We employ the use of technology tools that have been court-accepted, as well as a variety of other technology tools that are at our client's disposal.

IT Risk and Security

Our professionals specialize in system security risk, combining forensic auditing investigation techniques with technical knowledge of computer information systems, networks, and supporting hardware. Our specialists are experienced with computer security forensics, security monitoring, and fraud prevention. Further, we offer a full range of data recovery and retention services.

Risk Verification/Due Diligence

Our professionals support key stakeholders and their legal advisors with due diligence of prospective transactions and relationships. The Urish Popeck team discovers, verifies, and analyzes information that can alert clients to potential risk, and we assist with risk mitigation through a comprehensive process of in-depth background checks, interviews, and detailed analyses. These services provide key stakeholders with an in-depth look at risk elements of prospective deals.
